Model Photospheres with Accelerated Lambda Iteration

K. Werner, S. Dreizler, J.L. Deetjen, T. Nagel, T. Rauch, S.L. Schuh

Institut für Astronomie und Astrophysik, Universität Tübingen, Germany

We review the computational procedure to construct classical line-blanketed NLTE model atmospheres with the ALI method. In detail we discuss: Approximate Lambda Operators, fast solution techniques for non-linear rate equations, pre-conditioning of rate equations, super-level approach for heavy metal line-blanketing. Most recent successes and failures in applications are shortly presented.
