The WISE IR Excesses around Degenerates (WIRED) Survey has been designed to find low mass companions and dusty disks around white dwarfs using NASA's Wide-field Infrared Survey Explorer (WISE) mission. WISE has covered approximately 70% of its planned scan of the IR sky, and we have currently cross-correlated the SDSS DR4 white dwarf catalogue with 2MASS, UKIDSS, and WISE photometry to identify candidate excess sources. We present some candidate excess sources that have already been identified with WISE detections.
